

Principal component analysis
versus
Latent semantic analysis

<i>Principal Component Analysis</i>	<i>Latent Semantic Analysis</i>
One of the methods for automatically reducing the number of features of a dataset is called <i>principal component analysis</i> .	<i>Latent semantic analysis</i> is a form of data preparation used in natural language processing (NLP) for working on textual data.
Motivation: Modelling the data with many features is indeed challenging and it's hard to distinguish which of the features are relevant.	Hint: semantics = meaning
